/api/artifacts/{path}

GET

Summary: Describe an artifact directory or read an artifact file

The first path segment is the root (sec, forwarder or scripts). A directory answers with its entries, a file with its content and sha256.

Parameters

Name	Type	Required	Description
path	string	Yes	
pattern	string	No	fnmatch glob applied to entry names

Responses

404

PUT

Summary: Create or overwrite an artifact file

Validates the content for the root (forwarder YAML, script shebang), then replaces the file atomically; a refused write leaves the previous file untouched. Scripts are written mode 0700, other files 0600. No reload is triggered.

Parameters

Name	Type	Required	Description
path	string	Yes
